

UX Problem & Solution Proposal

Product: Google Pay

For Reference Only — Scenario B: GPay Youth Drop-off

■ Sample Submission (For Reference Only)

This document shows you what a complete proposal looks like. Read through it carefully, then write your own — with a different product, a different problem, and your own solution.

Problem

Users aged 18–22 open the Investments section on GPay but leave within **10 seconds** — before interacting with any feature. This represents a high-intent audience abandoning at the very first screen.

Who is affected?

First-time investors aged 18–22: college students and young earners who are curious about investing but have never done it before. They open Investments out of curiosity but feel lost or overwhelmed immediately.

Solution

Introduce **"Invest in 60 seconds"** — an AI-guided onboarding layer that meets users where they are:

1. **Mood-based entry screen:** Replace the cold dashboard with 3 simple prompts — "Save for a trip", "Grow my salary", "Just curious" — so users feel seen immediately.
2. **AI simplifies terms inline:** Every financial term (SIP, NAV, ELSS) shows a one-tap plain-English explanation without leaving the page.
3. **Rs.100 Starter path:** Recommend one low-risk fund with a Rs.100 minimum — showing exactly what Rs.100/month looks like in 5 years using a visual projection.
4. **Risk meter:** A 3-step slider (Safe → Balanced → Bold) that instantly reorders fund suggestions — no forms, no jargon.

Tradeoff

- Simplifying the UI risks feeling "dumbed down" to users who already know investing — a potential trust issue with experienced users sharing the same screen. **Fix:** Detect prior engagement (past SIPs, watchlist usage) and skip the onboarding layer for returning investors.

How AI helps

- Personalises fund recommendations based on user's stated goal and risk level — no account history needed.
- Auto-generates "Why this fund?" summaries in plain language (not fund-house marketing copy).
- Detects hesitation patterns (repeated back-navigation) and surfaces a "Still confused? Ask me" chat nudge.
- Learns over time: users who pick "Grow my salary" get investment nudges around salary credit dates.

Data to collect before larger changes

1. Heatmap of exact exit points: are users leaving at the fund list, the SIP page, or the KYC gate?
2. Session recordings (anonymised) of the first 10 seconds: what do eyes land on first?
3. Micro-survey: one question popup after exit — "What stopped you?" with 4 options.
4. A/B test the entry screen (current vs mood-based) on 5% of 18–22 traffic.

Success

- Time-on-page for 18–22 cohort increases from <10s to >45s within 4 weeks.
- First investment completion rate (18–22) improves by 20% in 8 weeks.
- AI explanation tap rate >30% (confirms the comprehension gap is real).
- Return visit rate: % of users who open Investments again within 7 days.

Final Pitch

GPay already has the trust. What 18–22 year olds are missing is a translator — someone who turns "mutual fund NAV" into "your money, growing". An AI-powered onboarding layer doesn't change the product; it changes who the product feels like it's *for*. That shift from "this is for adults" to "this is for me" is what converts a 10-second bounce into a Rs.100 first investment — and a lifelong user.

What made you think of this problem?

- **I personally noticed this pattern while using GPay.** High open rate + near-zero engagement in the 18–22 cohort is a classic "intent without action" signal — a clear sign the UI has a communication problem, not a product problem.

- **Note:** This is a sample to show the format. Choose your own product and problem statement for your submission.
